

What You Need To Know

“Killing our pets?? But I thought vaccinations were to *protect* our animals and keep serious diseases from possibly taking their lives. I don’t get it.”

We all think of vaccinations as being disease *fighters*. And they are. You give your cat a distemper shot and that cat *most likely* won’t get distemper. But I want to show you in this book how many believe that vaccinations can also be disease *inviters*, triggering the appearance of all sorts of maladies, from allergies to cancer.

Many owners of dogs and cats, if not most, simply aren’t aware of the possible dangers inherent in immunizations. Those “annual booster shots” that seem so taken for granted have got to be questioned, in light of what is now known. The laws of localities that mandate too frequent, sometimes *annual* rabies shots have got to be

abolished. We're simply giving *too many* shots *too often* for *too many* diseases (quite a few of which your pet has practically *zero* chance of getting).

If you care about your dog or your cat, you simply can't ignore the multitude of threats that vaccines could possibly pose to each and every one of them. You can't wait until it's too late. You can't say "I'll cross that bridge when I come to it." More vaccines are being injected into our pets today than ever before in our history. While it's true that rabies and some other diseases have been virtually eliminated in our pet population, our animals are coming down with more allergies than ever before, more stress, and most notably: more *cancer* than they were getting even a few years ago! One recent study shows that in the state of New York the cancer rate among dogs has increased 150% in the last four years. This, while our air and water are actually improving.

Why?

If you don't know the specific dangers being claimed, it's time you educated yourself. That's what this book is about. I'll explain what vaccines are and how they work. I'll show you what leading immunology experts are recommending – that you can cut down on the frequency of shots and still protect your pet. I will

show you how to determine what inoculations are completely unnecessary for your particular dog or cat. I'll explain how, according to much current thinking, vaccines lower the immune system, leaving your pet vulnerable to serious – sometimes fatal – diseases. I'll give you the facts. I'll relate the findings of leading veterinarians, experts, and the results of pertinent surveys. I'll tell you why many breeders have abandoned vaccinations completely.

I'm not going to tell you to never again vaccinate your pet (although a good many are choosing that route nowadays). On the other hand, I'm not going to tell you, as many believe, that vaccinations are the best way to go. But I hope to lay out the pros and cons so that you can make up your own mind as to what path you will follow.

It's my intention that after reading this book you'll be able to make more informed, intelligent decisions about which vaccinations to

SHOT SNAPSHOT

Pets that undergo chemotherapy are typically forbidden to receive ANY shots for the rest of their lives. (Our dog Sparky, a cancer survivor, has not had a single vaccination in SIX YEARS.)
